1) 파이썬 라이브러리인 배열을 활용한 시뮬레이터 코드 – 파일명: LRU_sim1

```
class CacheSimulator:
   def __init__(self, cache_slots):
       self.cache_slots = cache_slots
       self.cache = []
       self.cache hit = 0
       self.tot_cnt = 1
   def do_sim(self, page):
       if page in self.cache:
           self.cache.remove(page)
           self.cache.append(page)
           self.cache_hit += 1
       else:
           if len(self.cache) == self.cache_slots:
               self.cache.pop(0)
           self.cache.append(page)
       self.tot_cnt += 1
   def print_stats(self):
       print("cache_slot = ", self.cache_slots, "cache_hit = ",
self.cache_hit, "hit ratio = ", self.cache_hit / self.tot_cnt)
if __name__ == "__main__":
   data file = open("./linkbench.trc")
   lines = data_file.readlines()
   for cache_slots in range(100, 1001, 100):
       cache_sim = CacheSimulator(cache_slots)
       for line in lines:
           page = line.split()[0]
           cache_sim.do_sim(page)
       cache_sim.print_stats()
```

page 의 캐시 여부를 확인한 후 존재할 시 캐시 히트 발생, 가득찰시 가장 오래된 페이지를 제거함. 그리고 총 요청횟수를 기록함.

실행결과 화면:

```
jo\list\LRU_sim1.py"

cache_slot = 100 cache_hit = 14554 hit ratio = 0.14553854461455384

PS C:\Users\parkj\OneDrive\\H\ \operatorus \opera
```

2) 파이썬의 연결리스트 CircularLinkedlist를 이용한 시뮬레이터 코드 – 파일명: LRU_sim2

```
from circularLinkedList import CircularLinkedList
class CacheSimulator:
    def __init__(self, cache_slots):
       self.cache_slots = cache_slots
       self.cache = CircularLinkedList()
       self.cache_hit = 0
       self.tot_cnt = 1
    def do_sim(self, page):
        if self.cache.size() < self.cache slots:</pre>
           if self.cache.index(page) != -2:
                self.cache_hit += 1
           else:
                self.cache.append(page)
       else:
           if self.cache.index(page) != -2:
               self.cache.remove(page)
               self.cache.append(page)
               self.cache_hit += 1
           else:
               self.cache.remove(self.cache.getNode(0).item)
               self.cache.append(page)
        self.tot cnt += 1
    def print_stats(self):
        print("cache_slot = ", self.cache_slots, "cache_hit = ",
self.cache_hit, "hit ratio = ", self.cache_hit / self.tot_cnt)
```

```
if __name__ == "__main__":
    data_file = open("./linkbench.trc")
    lines = data_file.readlines()
    for cache_slots in range(100, 1001, 100):
        cache_sim = CacheSimulator(cache_slots)
        for line in lines:
            page = line.split()[0]
            cache_sim.do_sim(page)

        cache_sim.print_stats()
```

우선 기존 실습시간에 했던 CircularLinkedlist를 추가적으로 수정하였다.

(git에 수정된 CircularLinkedlist 다시 업로드함.)

CircularLinkedlist파일을 import해주고 기존의 시뮬레이터 코드에서 새롭게 추가 및 작성하였다.

실행결과 화면:

```

```

배열을 사용한 코드보다 일부 캐시 히트 값이 1씩 작게 결과값이 도출되었다. 처음엔 호출 카운 트가 하나 배제돼서 발생한 문제라 생각하고 코드를 검토하였지만 일부 캐시 히트만 값이 다른것을 보아 다른 부분에서 발생된 오류라 판단하였다. 또한 hit ratio의 값을 포함하여 소수점 몇 자리의 오차범위내의 오차기에 감안하고 실습을 진행하였다.

3) 2번의 내용을 C언어로 구현하시오 - 파일명: LRU sim3

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

typedef struct Node {
   char *item;
   struct Node *next;
```

```
} Node;
typedef struct CircularLinkedList {
   Node *head;
   int size;
} CircularLinkedList;
CircularLinkedList *initializeList() {
   CircularLinkedList *list = (CircularLinkedList
*)malloc(sizeof(CircularLinkedList));
    list->head = NULL;
   list->size = 0;
   return list;
void append(CircularLinkedList *list, char *item) {
   Node *newNode = (Node *)malloc(sizeof(Node));
   newNode->item = strdup(item);

```

파이썬으로 작성한 코드를 C로 새롭게 작성하는 과정에서 파이썬에선 기본적으로 가능한 파일 불러오기나 내장함수, 메모리 할당 및 문자열 처리등에 대해 파이썬보다 더욱 정교하고 많은 함 수를 요구하여 코드의 길이가 매우 길어짐.
